Payli™

# A good evening

# deserves a good ending.

*Company profile*

Hospitality software, built in Amman

Edition November 2026

# Built in Amman for the last five minutes of dinner.

The end of a good meal is usually the worst part of it: waiting for the bill, waiting for the card machine, doing arithmetic at the table. Payli fixes those five minutes, and gives the restaurant an exact record of every one of them.

Payli is hospitality software. It takes the two slowest moments of eating out, waiting to pay and waiting to collect, and moves them to the guest's own phone, while the house keeps an exact record of each.

At the table, your guests scan a QR code, see the itemised bill, split it, add a tip and pay, with no app to download. At the counter, the same phone takes the place of the plastic buzzer. The first is in closed beta; the second is in development.

## *What Payli is, and what it is not*

Payli is not a bank, not a payment company and not a point of sale. It is software that sits beside the payment and beside the till. It is operated by a company registered in the Hashemite Kingdom of Jordan, and is based in Amman.

## *Whom we serve*

Table-service restaurants and cafés; counter service such as coffee shops, bakeries, fast food and food-court outlets; and the owners, managers, floor and counter staff and finance teams behind them.

# What we hold ourselves to

A restaurant is judged on what it does every evening, not on what it says once, and the same ought to be true of any software it lets near its guests. Payli keeps four standards. They are set down here as plainly as we can put them.

| | |
|---|---|
| *Beside the payment* | never in it |
| *Beside the till* | never instead of it |
| *On the guest's own phone* | with nothing to install |

### *Exact to the fils*

Money is recorded in whole fils in a double-entry ledger, and nothing is rounded to make a screen look tidy. Amounts are shown in JOD to three decimals, and tips are kept apart from sales.

### *Both languages for every guest*

English and Arabic are offered on every guest screen, and it is the guest who chooses. The restaurant dashboard is in English today, and we say so.

### *No surprises at the table*

Your guests see exactly what they will pay before they pay it. Tips go to the restaurant in full, Payli takes no fee on them, and card details never reach Payli at all.

### *Honest about the beta*

Payli is in closed beta. We say what works today and what is still to come, in this document and in every demonstration, and each product here carries its true status.

Payli is in closed beta in Amman, Jordan, and is talking to its first restaurants; no restaurant is live yet.

*The last five minutes are the least hospitable part of the evening, and they are the part the guest remembers on the way out.*

### *At the table*

The meal is over and your guest is ready to leave, but the bill has still to be asked for, printed, carried, split by hand and paid on a terminal that is, at that moment, on another table.

### *On the floor*

Every bill run and every terminal run takes a member of your team off the floor at the busiest point of the service. Splitting a bill six ways at the table is arithmetic nobody was trained for.

### *At the close*

Payments, tips and POS sales are counted separately and reconciled by hand. Tips become mixed with sales, and numbers that should match do not.

### *At the counter*

Guests who have ordered stand and wait, because they cannot know how long it will take, or they sit down holding a plastic buzzer. Buzzers walk off, run flat and get sticky. They are hardware to buy, charge, clean and replace.

---

*The opportunity*

## Every guest already carries a better device than any restaurant could hand them. Payli puts the bill, the split, the tip and the order alert on that device, with nothing to install, and gives the restaurant the record.

# What we offer

Payli is three things that share one dashboard and one guest web app. Each is listed here with its true status, much as a menu lists only what the kitchen can send out tonight.

## Pay at Table ..... Closed beta

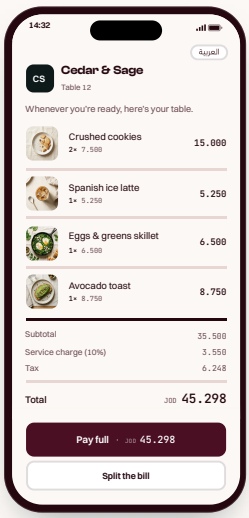

Guests scan the QR code on their table, see the itemised bill, split it, tip and pay from their own phone. There is no app.

## Restaurant Dashboard ..... Closed beta

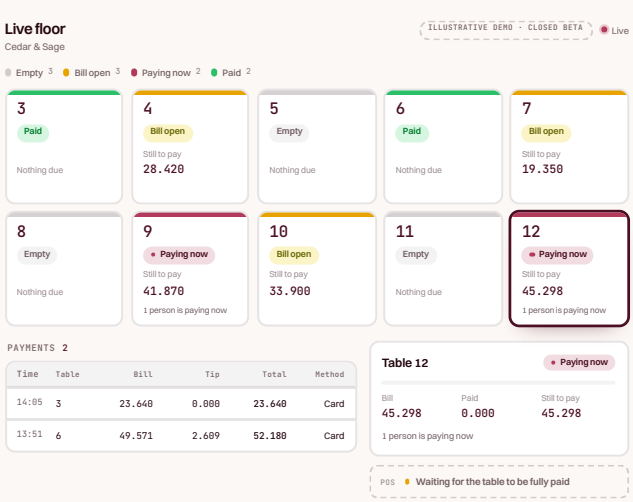

One dashboard, in a browser, for the floor, the payments and the end-of-day numbers. It runs on any tablet, phone or laptop.

## Order Pager ..... In development

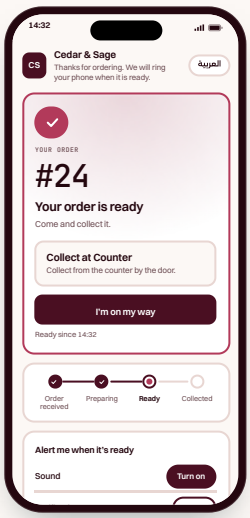

The guest's own phone replaces the buzzer: they scan at the counter, follow the order and are alerted when it is ready. Not yet live at any venue.

Pay at Table: the bill, on the guest's phone

Restaurant Dashboard: the live floor, with Table 12 paying now

Order Pager: the order is ready

### What it connects to

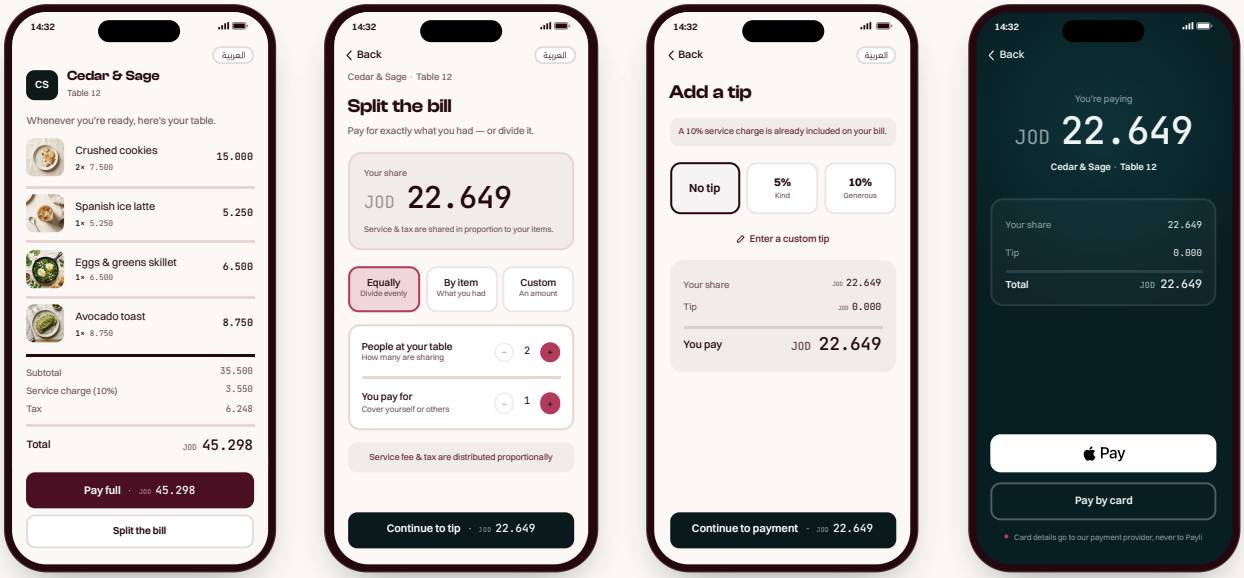

Cedar & Sage is a fictional venue used for illustration.

| | | | |
|---|---|---|---|
| AQUA POS | in development | Oracle MICROS Simphony | planned |
| Foodics | in development | POSRocket | planned |

"In development" means the connector is being built and tested against the vendor's test system and is not live at any restaurant. "Planned" means not built yet. Payments run through a licensed payment provider; we confirm which is available for your venue in the walkthrough.

# Pay at Table

Closed beta

### 1 Scan

One QR code on each table. The itemised bill opens in the phone's browser: no app, no sign-up, no Wi-Fi password.

### 2 Split

Evenly, by item, or any amount. Service charge and tax follow the items in proportion.

### 3 Tip

5%, 10%, a custom amount, or none. The full tip goes to the restaurant; Payli takes no fee on it.

### 4 Pay

Visa or Mastercard, and Apple Pay or Google Pay where the payment provider enables them, on the provider's own secure page.

The screens show Cedar & Sage, a fictional venue used for illustration.

## *For your guests*

Your guest needs nothing but the phone already in their hand. Nobody can pay twice for the same item, and the table stays open until the last share is paid. Afterwards a confirmation appears on screen, and the guest may leave a rating from one to five stars, with a comment. Every guest screen is offered in English and Arabic, with amounts in JOD to three decimals.

*Payli is software. It never holds your money: each payment settles directly into your own merchant account.*

## *For your team*

The live floor shows every table in one of four states, Empty, Bill open, Paying now or Paid, and is designed to be read from across the room. Each payment appears as it happens, with its table, bill, tip, total, method and time.

Your team can print a receipt for any payment, start a refund from the same screen, recorded with who and why, and export the day as a spreadsheet. Tips are shown apart from sales, in a ledger that is exact to the fils. Only a fully paid bill is posted to your POS; partial payments never are. The dashboard runs in a browser on any tablet, phone or laptop, and is in English today.

# Order Pager

In development

The guest's own phone takes the place of the buzzer. They scan a QR code at the counter, follow the order from their seat, and are alerted when it is ready: no app, no account and no phone number.

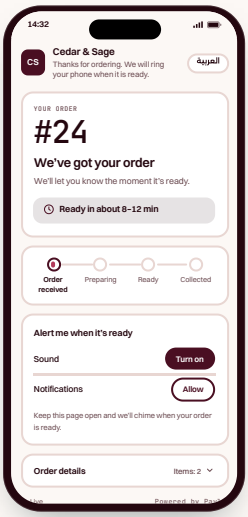

At the counter, your team presses New order, adds what was ordered or leaves it as a quick ticket, and shows the guest the QR code. On the board each order moves through New, Preparing and Ready. Your team presses Start, then Ready & ring, and Collected when it is handed over. Only your team moves an order; nothing advances on a timer.

*In development. Not yet live at any venue.*

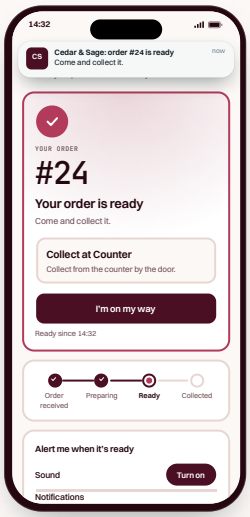

The Order Pager is built, and is shown in demonstrations.

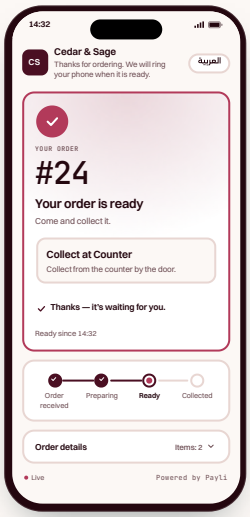

Photo: Shixart1985 / Wikimedia Commons, CC BY 2.0 (adapted)

1 The order page opens with a number, a timeline and an estimate.

2 "Your order is ready", and where to collect it.

3 The guest taps I'm on my way.

What the counter sees back: whether a guest has joined, whether the phone received the alert, and "On the way". The board reports that the phone received the alert, never that someone heard it.

### Honest wait times

An estimate may be a fixed range, a range computed from the items and the kitchen's stations, or none. Your team can change it at any time, and the page never invents a number.

### Your house, on their phone

Logo, colours, one of three themes, a welcome line, pickup instructions and the wording of each status, in English and Arabic.

### Beside any till

Your team creates the order after taking payment however they do today. Cedar & Sage is a fictional venue used for illustration.

# The order of service

One table, from the moment the bill is wanted to the close of the day: what your guest sees on the left, and what the house sees on the right.

| The guest's phone | The moment | The house |
|---|---|---|
| Scans the table's QR code, and the itemised bill opens. | *The bill is wanted* | Table 12 shows Bill open on the floor. |
| Chooses to split evenly, by item or by an amount. | *Sharing* | Nothing to do, and no bill run. |
| Adds a tip, or none, and pays on the provider's page. | *Paying* | Table 12 shows Paying now. |
| A confirmation appears on screen. | *First share paid* | The payment appears in Transactions, with its table, bill, tip, total, method and time. |
| The table is settled. | *Last share paid* | Table 12 shows Paid, and the finished sale is posted to the POS. |
| May rate the visit, from one to five stars. | *Afterwards* | The rating lands in the dashboard, and the day closes exact to the fils. |

## The restaurant's day, with Payli

### *Before service*

The menu and the tables are in the dashboard, and each table has its QR code.

### *During service*

The floor shows every table's state, and your team stays with your guests. At the counter, orders move across the board and phones ring instead of buzzers.

### *At the close*

Transactions export as a spreadsheet, tips sit apart from sales, and only fully paid bills have reached the POS.

Pay at Table and the dashboard are in closed beta. The Order Pager, at the counter, is in development and not yet live at any venue.

# Who it is for, and why

### *Table-service restaurants* ..... Pay at Table

Casual to premium, with the dashboard for the house.

### *Cafés with seating* ..... Pay at Table

When guests can pay from their seat, the queue at the till gets shorter and your team stays on the floor.

### *Counter service* ..... Order Pager, in development

Coffee shops, bakeries, fast food and food-court outlets.

### *Restaurant groups* ..... venue by venue

Each venue is set up with its own menu, tables, team and settings, and its data is kept separate from every other venue's. Tell us how your group is organised and we will show what is ready.

### *Partners* ..... by enquiry

POS vendors and payment providers: Payli connects to the POS for the menu and the finished sale, and to a licensed provider's hosted payment page.

**It is honest about its stage**

Closed beta, with its first restaurants being chosen now, and it says what is ready.

**It never touches your money**

Payments settle to your own merchant account. Payli's fees are invoiced, never deducted.

**It is exact**

Whole fils, an append-only ledger, and only fully paid bills in the POS.

**It asks nothing of your guest**

No app, no account and no phone number.

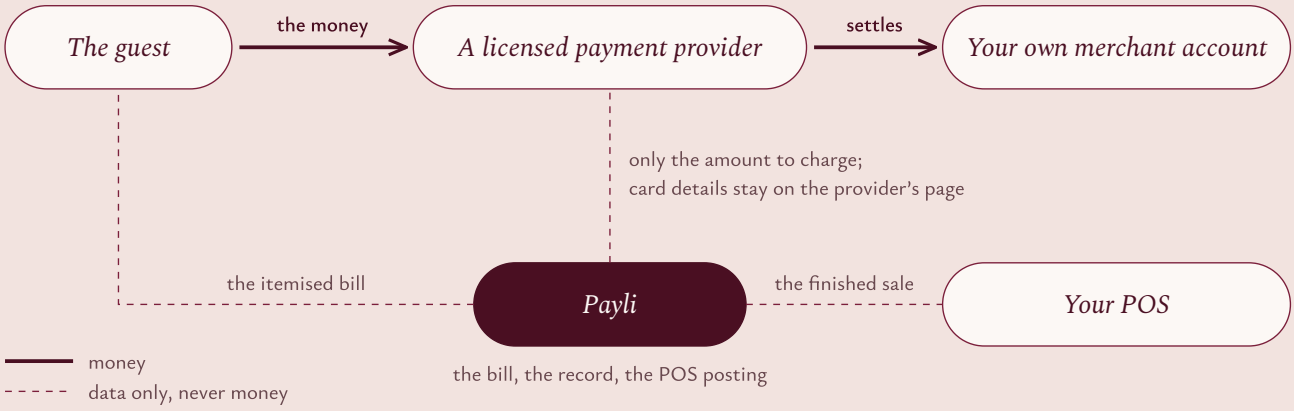

**It is built in Amman**

In English and Arabic, for how restaurants here work.

**It needs no hardware**

Guests use their phones, your team uses a browser, and you print a QR code for each table.

## Payli sits beside the payment, never in it.

You are the merchant of record. Payli never holds, pools or pays out funds, and its own fees are invoiced separately. Refunds start in the dashboard and are returned by the provider to the original card.

Payli itself hasn't yet been independently audited or certified, including against PCI DSS, and doesn't claim to be. Card details are entered on the provider's page and never reach Payli.

# We would be glad

# to show you.

### *How we get you started*

1. **See it on your phone.** A 15-minute walkthrough of the guest's side and yours.
2. Check the fit. Your POS, your payment provider, and what is ready for your venue.
3. **Set up your venue.** We create your venue, connect your POS and bring in your menu and service charge.
4. **A QR on every table.** Add your tables in the dashboard and print a QR code for each.
5. **Brief the team.** The floor board, receipts and refunds.

### *What you will need*

A POS that Payli connects to, or one you would like us to connect; a merchant account with a licensed payment provider; any tablet, phone or laptop with a browser; and a printed QR code for each table.

### *On terms*

There is no published price list: pricing depends on the venue, and we go through it with you in the walkthrough. There is no hardware to buy, fees are invoiced separately and never deducted, and there is no fee on tips. We are choosing a small first group of restaurants in Amman.

To see it on your own phone
